

PHOTON[®] SG 50

Increase productivity and
ensure quality
even under stressful conditions

January 2025

What is PHOTON?

- **PHOTON[®] SG 50** is a high active, solid, dust-free, organic-mineral special fertilizer with a very good price/performance ratio
- **Marketing:** Successfully on the market in numerous countries in the southern and northern hemisphere since 2015, tested and widely used in both specialty crops and arable farming!
- **Formulations:** PHOTON[®] SG 50 (extruder granules) and liquid formulations, also private labels
- **Patents:** NEW technology, patented worldwide until 2029, mixture patents with new partners granted until 2040 and beyond
- **Ingredients:** Mix of 4 dicarboxylic acids of natural origin (mainly azelaic acid) with contents of potassium (22% K₂O), magnesium and boron.
Note: Azelaic acid is also used worldwide as an ingredient in cosmetics.

What else about PHOTON?

- **Application:** Simple application via fertigation/irrigation or foliar treatment, the product is rainproof on the plant after 2-3 hours
- **In the plant:** Systemic distribution of the active ingredient within 24 hours, degradation in the cell after 2-3 weeks, no residues
- **In practice: FOR BEST RESULTS** - Targeted, preventative (early) application, depending on the crop, 2 - 4 x applications in combination or in spraying sequence with crop protection/ leaf fertilizer, tried and tested in practice. In fruit growing, up to 6 x applications is also common for late varieties.
- **Crops:** Can be used in all crops, very good plant compatibility
- **Dosage:** 20 to 40 g/ha/application, depending on crop, strong effect with low application rate
- **Mixability:** Very good, with most important crop protection products and foliar fertilizers, synergistic effect with micronutrients and some biostimulants (spray sequences and tank mixtures),
-> for more information, use our service hotline!

TARGETS for plant production in row crops

PHOTON[®] promotes

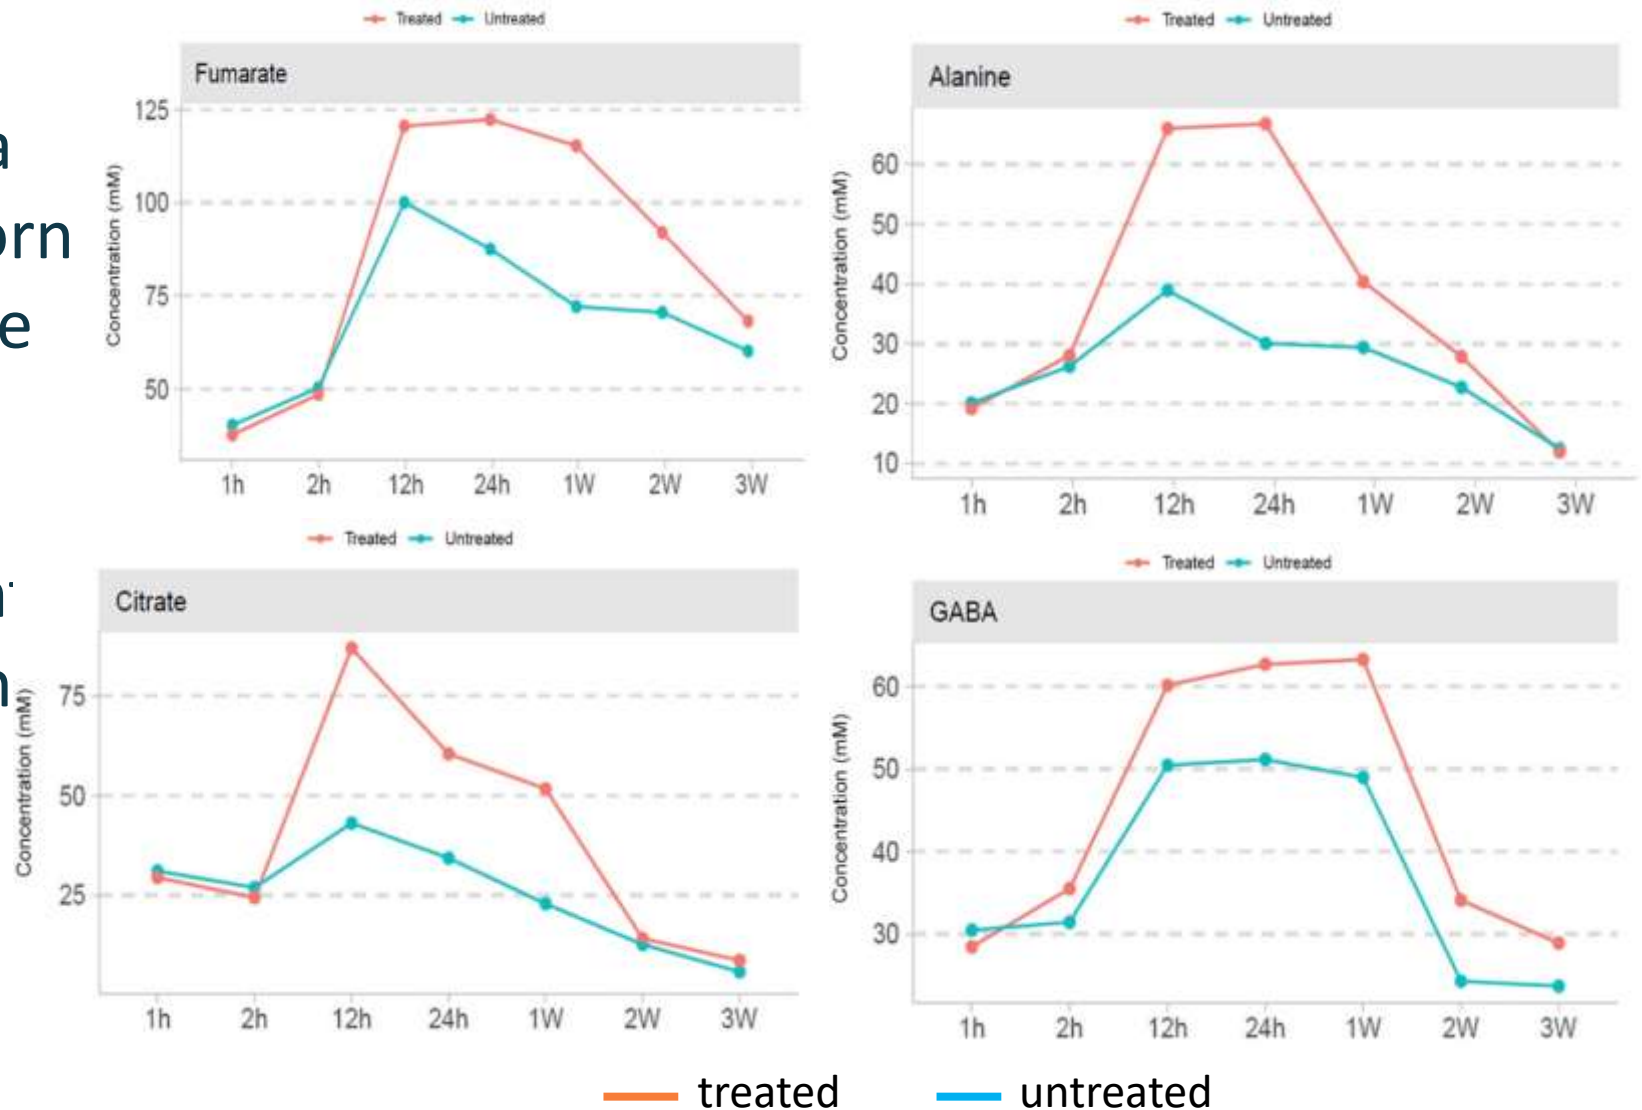

- **In general:** early application promotes early leaf development and root growth
- **in potatoes,** the tuber plant, uniformity of tuber development and increase in size, thus increasing the marketable part.
It can be used in any production segment, i.e. seed-, table-, processing- (french fries and chips) and starch potatoes
- **for sugar beet:** increase in yield/ha and adjusted sugar yields
- **for grain maize:** promotion of cob development and cob weight
- **for legumes:** support the development of pods and increase the yield

A prerequisite for the best results:

1. **follow the instructions for use:** use as early as possible, keep an interval of 3 weeks!
- 2 PHOTON[®] only works optimally on fields managed with **good agronomic practice** (soil cultivation, fertilization and plant protection) -> **use the service hotline!**

How does PHOTON work?

Recent studies by the University of South Africa on **soybeans** and grain corn confirm earlier data in the literature: PHOTON promotes the formation on a number of important organic acids, proteins and enzyme systems.

The increased values of ingredients that play a decisive role in the reaction of plants to abiotic stress allow an insight into the biochemical processes in the plant on which the positive (yield-increasing) results in trials with PHOTON are based.

In addition, the graphs provide a reason for the treatment intervals - in order to keep the ingredients at a high level, it makes sense to repeat the treatment after 3 weeks.

Source: Research article

¹H-NMR-based metabolomic profiling and proteomic analysis of soybean (*Glycine max* L.) in response to the application of dicarboxylic acids (Photon) as stress inducers.

Mhlonipheni Nhlakanipho Msomi , * Gerhard Prinsloo , Noluyolo Nogemane

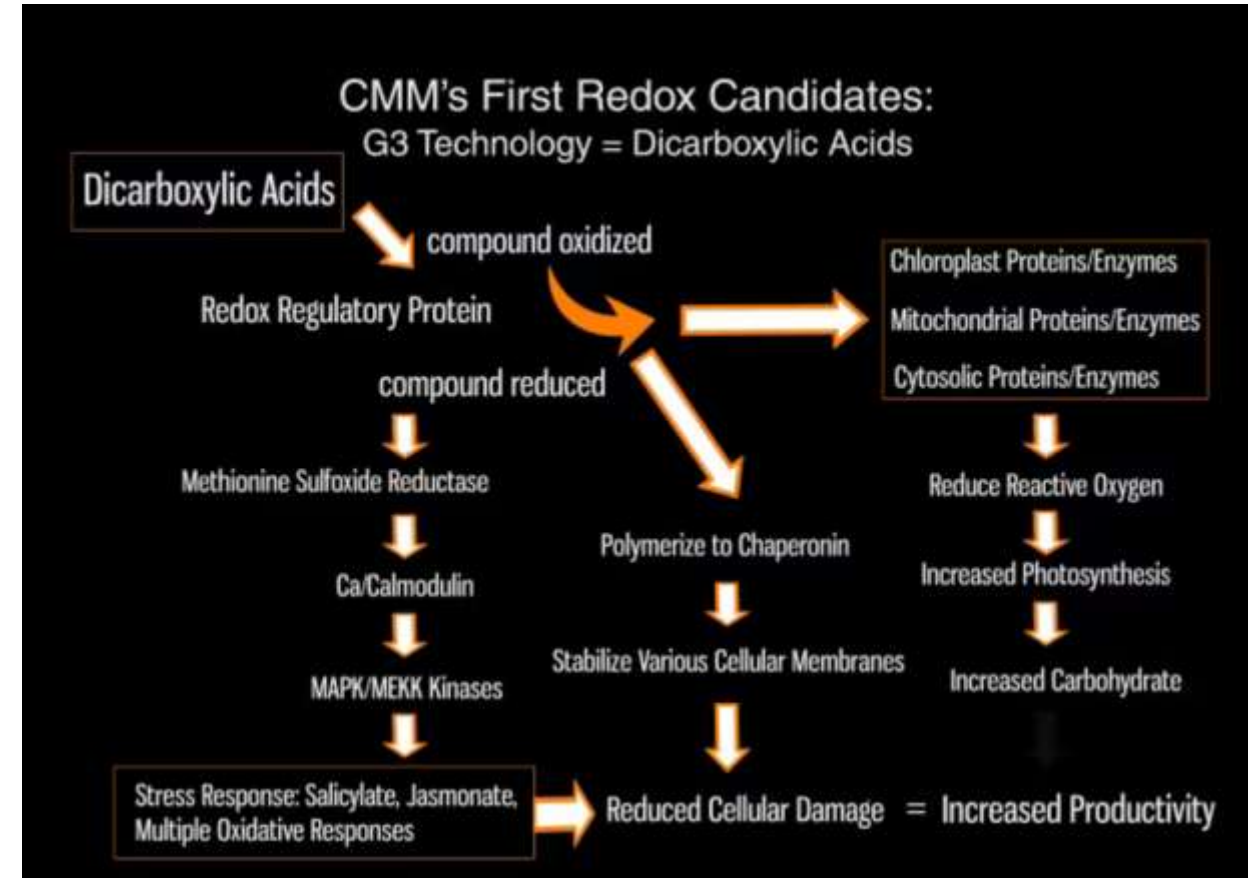

Department of Agriculture and Animal Health, Florida Science Campus, University of South Africa, Johannesburg, Gauteng Province, South Africa

The increased content of important substances in the plant through the use of PHOTON

- **stabilizes** membranes and cell structures (chaperonin function),
- **improves** the nutrient efficiency of calcium (calmodulin effect)
- **neutralizes** damaging radicals.

This increases and maintain the photosynthesis performance, as well as fruit/tuber and root formation and thus a sustainable yield.

This is particularly important under stressful conditions.

What role do stress factors play?

Just as in humans, certain environmental influences, e.g. stress caused by pesticides (i.e. Phytotox), cold and heat or radiation stress and other factors, also cause the formation of **free radicals** in plants.

These can affect the health and vigor of the plant, the condition of the cells, the firmness of tissue and skin, e.g. in fruits. The PHOTON application can help to counteract this.

To make optimum use of the protective effect, it is necessary to use PHOTON right in time and thus also preventively. When used preventively, dicarboxylic acids act as a kind of vaccine ("priming").

Free radicals lack an electron.
They remove this electron from other cells and thus damage their structure.

In which crops is PHOTON used?

PHOTON has been used worldwide for several years in numerous countries:

- In arable farming (in the USA mainly grain corn and soybeans, approximately 1.3 million hectares in 2024)
- In fruit crops (in the southern hemisphere mainly citrus, pome-, stone- and berry fruit and soft fruit, vine - and table grapes)

The result: improved yield and quality in all important crops, even under stress conditions

Application recommendation (selection)

Culture	Dosage/ Application	Remarks
	40 g/ha (60 ml/ha)	Preventive
Sugar beet	3 - 4 applications, Interval 3-(4) weeks	From NAK ₁ in combination with crop protection and fertilization
Cereals, grain maize, legumes, rapeseed	2 applications, see separate instructions	1st juvenile stage, 2nd before generative phase for maize up to 80 cm in height
Citrus fruits	4-6 applications Interval 3 weeks	From 1 month before flowering until harvest
Pome and stone fruit, nuts	4 - 6 applications Interval 3 weeks	From flowering up to 3-4 weeks before harvest
	20-40g/ha (30-60ml/ha)	Preventive
Potatoes, vegetables (all types)	Usually 3-4 applications, interval 3 weeks	Start after planting (drenching also possible) Possible up to 3 weeks before harvest
Wine & table grapes, soft fruit	3 - 6 applications Interval 3 weeks	From flowering to shortly before harvest

Application

- For the sake of simplicity, we recommend volumetric dosing (doser included)
- **Particularly interesting:** Same application rate per ha for foliar application and fertigation/irrigation.
- When used alone, it is best to mix the product with non-ionic surfacants, e.g. Break Thru, Hasten etc.
- In combination with crop protection products, an adjuvant is helpful, but not absolutely necessary
- PHOTON is available in containers of
500 g (750ml),
2 x 500g (1kg pack) and
6 x 1kg pack (6kg carton) available

Application examples from the years 2023 and 2024 in potatoes and sugar beet

- In 2023 and 2024, the dosages and spraying sequences already tried and tested in other countries were validated throughout Germany (partly in Austria and Italy).
- Objective: Serious recommendation for D-A-CH taking into account the regional location conditions (facts and figures)

2 cultures as an example:

- **Potatoes:** 9 random trials and 10 practical tests, regional focus on Lower Saxony, North Rhine-Westphalia, Rhineland-Palatinate and Bavaria
- **Sugar beet:** 10 random trials and 5 practical tests, regional focus on Saxony-Anhalt, Lower Saxony, North Rhine-Westphalia and Bavaria

Potatoes

The ideal time to start the application:
As early as possible, BBCH 15 at the latest

Number by tuber size

Yield by tuber size

PHOTON[®] SG 50 in POTATOES, CONCLUSION:

Using PHOTON[®] SG 50 correctly, we see the following advantages for the farmer:

- **Yield:** due to a better tuber set and subsequent advantageous tuber development, yield increases of at least 7% to 14%. These results could be achieved in Chile, the UK, the USA and in the trial years 2023/24 in Germany. This at a yield level of 50 to 70 tons/ha
- **External quality:** Significant increase in fraction from 35 to 55 mm and larger
- **Internal quality:** slight increase in starch content (0.5 to 1%)

Use of PHOTON[®] SG 50 in POTATOES:

Start of the treatments:

- preventive use is a must!
- As early as possible, prerequisite uniform emergence of the plants, stage: e.g. "potatoes hand-width high", BBCH 15 at the latest

Dosage (in Central Europe)

both in "normal years" and in "expected stress"

- **Standard:** 40 g/ha , (3)- 4 x , 3 weeks interval,
3 x applications, e.g. for early table potatoes,
4 x appl. e.g. for table potatoes, processing potatoes (French Fries, Potato Chips etc.) and starch potatoes
- **Basis:** 20 g/ha, 4 x, 3 weeks interval, e.g. seed potatoes or mixture with biostimulants (**enquire about type and dosage by telephone**)

06.09.2024	95	100
26.09.2024	93	100

PHOTON® SG 50 in SUGAR BEETS, CONCLUSION:

If PHOTON® SG 50 is used correctly, we see the following advantages for the farmer:

Yield: at a yield level of 70 to 100 tons/ha, we expect an additional yield of at least 5 to 10 tons/ha on average, even under favourable conditions.

Prerequisite is: varieties with good resistance/tolerance properties are grown at the location and the fungicides and insecticides used are applied in accordance with the instructions for use (keeping an eye on threshold and apply products in time!)

Quality: slightly increased sugar content after PHOTON application, partial reduction of the alpha amino N content

In total: we see an increase in the adjusted sugar yield of at least 0.5 to 1.5 t/ha on average

Use of PHOTON[®] SG 50 in sugar beet:

Start of the treatments:

- Basically preventive use
- as early as possible, with uniform emergence provided.
Stage: best at the beginning of the 2-leaf stage,
4-leaf stage of sugar beet at the latest (e.g. NaK2)

Dosage:

Both in "normal years" and in years with "expected stress"

Central Europe: 40 g/ha , 3 - 4 x , 3 weeks apart
